

Hoseung Choi

☎ +82 10 9379 8637 @ me@startergate.dev

I bring experience across the full backend lifecycle — from building and operating a backend server supporting 750K MAU, to designing a distributed product data collection system processing 5 million records daily across multiple methods (crawling, external APIs, and product feeds), to running a multi-node database cluster and the cloud and on-premise infrastructure (including internal corporate networking) that supports it all.

I've been writing code since my student years, giving me about 9 years of development experience overall, including 5 years and 3 months in industry. Beyond backend, I've worked hands-on with adjacent frontend, infrastructure, and CI/CD needs, and I've owned end-to-end architecture design on several projects — the kind of cross-stack ownership that comes from working at a company where you're expected to see problems through from idea to production.

I've operated services across a mix of cloud providers — AWS, Google Cloud Platform, and Naver Cloud Platform — driven by real business constraints like cost, credits, and service-specific needs, which gave me first hand experience navigating the tradeoffs and limitations each platform brings.

At Fetching, I've collaborated closely with engineering teammates as well as a wide range of external partners — including MSPs like Bepin Global, payment and integration partners such as SmartRo and PortOne, e-commerce partners like Naver Shopping, merchants onboarded through Fetching's Partner Center, and public institutions on government-funded initiatives — building experience in cross-functional communication, service integration, and API partnerships.

Work Experience 5 years 6 months

Fetching

2020.12 - 2026.03 (5 years 4 months) | Full-time Employee | Back-end Engineer

Commerce Back-end

2021.08 - 2026.03 | Back-end Engineer

- Built and operated a commerce backend server supporting 750K MAU
- Contributed to building and maintaining an Elasticsearch-based search system covering 20 million product listings, improving search performance and reducing latency from ~1s to ~150ms
- Built and maintained a payment system through PG (payment gateway) integrations
- Extended the search infrastructure to develop an image similarity-based product recommendation system
- Developed and operated a product update system running on the frontend client

- Tech stack: TypeScript, Node.js, NestJS, React, Next.js, Aurora MySQL, Redis, Elasticsearch

Internal Admin & Operations Systems

2020.12 - 2026.03 | Back-end Engineer

- Built an internal admin tool supporting a range of functions, including commerce order management and collected product management
- Worked on the frontend using Next.js
- Built a remote control system for the product data collection pipeline using the AWS SDK and RabbitMQ, enabling the broader admin team — not just developers — to monitor, control, and respond to issues across multiple collection methods (crawling, external APIs, and product feeds)
- Built and improved a metrics system on top of data collected from commerce and product data collection processes
- Developed an order revenue settlement system to support accounting processes

- Tech stack: TypeScript, Node.js, NestJS, React, Next.js, Aurora MySQL, Redis, RabbitMQ, Elasticsearch

Product Data Collection System

2020.12 - 2026.03 | Back-end Engineer

- Built and operated a distributed product data collection system processing 5 million records daily across multiple methods (crawling, external APIs, and product feeds)
- Redesigned the pipeline to separate product collection (external) from data processing (within AWS), cutting network outbound costs and smoothing database load by eliminating usage spikes during peak collection periods
- Replaced Google Translate with a GPT-based product information translation system, improving accuracy and expanding coverage to previously unsupported categories
- Automated product categorization with a Gemini-based system, eliminating up to half a day of manual classification work per cycle that previously had no scalable solution

- Tech stack: TypeScript, Node.js, Aurora MySQL, RabbitMQ, Elasticsearch, AWS ECS

Infrastructure

2020.12 - 2026.03 | Back-end Engineer

- Designed and operated infrastructure spanning multiple clouds (AWS, GCP) and on-premise environments, and built CI/CD pipelines
- Built infrastructure monitoring and alerting systems using the AWS SDK and Grafana
- Kept database operations efficient under cost-constrained environments

- Tech stack: AWS, Aurora MySQL, Redis, RabbitMQ, Elasticsearch, Docker, Grafana

PFC Technologies

2020.01 - 2020.02 (2 months) | Intern | Back-end Engineer | Field Trainee (Internship)

Auth Middleware Refactoring

2020.01 - 2020.02 | Back-end Engineer | Field Trainee (Internship)

- Refactored the account authentication middleware and related features

- Tech stack: Django, Django REST Framework, Python

Education

Gwangju Software Meister Highschool

2018.03 - 2021.02 | Graduated | Department of Software Development

Studied a broad range of subjects, from fundamental CS and networking to backend development, C, C++, and mobile app development.

"Meister High School" is a specialized vocational high school focused on industry-aligned technical training.

Skills

RabbitMQ

ElasticSearch

TypeScript

React

Next.js

Nest.js

Redis

Node.js

AWS

MySQL

Awards & Others

Global BizCool CO-TDM Startup Competition

2018.06 | Awards

Excellence Award

Craftsman Information Processing

2019.03 | Certifications

Information Processing Technician, National Technical Qualification, Korea — issued by Human Resources Development Service of Korea (HRD Korea)

GSM Creative Algorithm Contest

2018.04 | Awards

Honorable Mention

2020 GSM Team Project Showcase

2020.10 | Awards

Honorable Mention

Languages

English | Advanced Business

TOEIC 865 | 2018.08.01
